SIT102 Test 2 (Practice) - 2026 T1

Student Name: ______________________________

Student ID: ______________________________

Official Use

◯ Complete ◯ Fix and resubmit ◯ Redo

The following struct and procedure are defined.

```
const int SIZE = 5;

struct stat_double {
  double  numbers [SIZE];
  double  mystery;
};

void who_am_i ( stat_double &data )
{
  int     i;

  data.mystery = data.numbers [0];

  for (i = 0; i < SIZE; i++) {
    if ( data.numbers [i] > data.mystery ) {
      data.mystery = data.numbers [i];
    }
  }

  return;
}
```

1. **Hand execute the code below using this procedure.**

```
// Initialise d.numbers with  {-20.0, 3.2, 1.9, -1.5, 1.3}
// and d.mystery with 0.0'.
stat_double d = { {-20.0, 3.2, 1.9, -1.5, 1.3}, 0.0 };

who_am_i ( d );
```

You are creating a system for managing computers in an office. The following fields are needed to represent a computer: (1) an identification number; (2) a description; (3) a location.

2. **Write a data structure named `computer_data` to capture these fields.**

3. **Write a function to read in the information for a `number_to_read` number of computers into `computer_list`.**

```
void read_computers ( computer_data &computer_list [], int number_to_read )
```

4. **Write the `main` function which asks the user for `computer_num` number of computers. Then call your `read_computers` function to read in data for `computer_num` computers. Finally, print the list of computers.**

```
int main ( )
{
const int      MAX = 100;     // Maximum size of array of computers
computer_data computers [MAX];     // Array of computers
int            computer_num;    // Actual number of computers stored

// Ask for number of computers

// Read in computer list

// Print list of computers

}
```
